### NOTES

Installation instructions:

The converters have to be installed according to the guidelines currently in force, like other open electronic component assemblies. Plug in not under voltage. Attention must be paid to sufficient ventilation, carry off heat, fastening and protection against accidental contact.

The pin B11, Case/PE : (), has to be properly connected in order to assure operation.

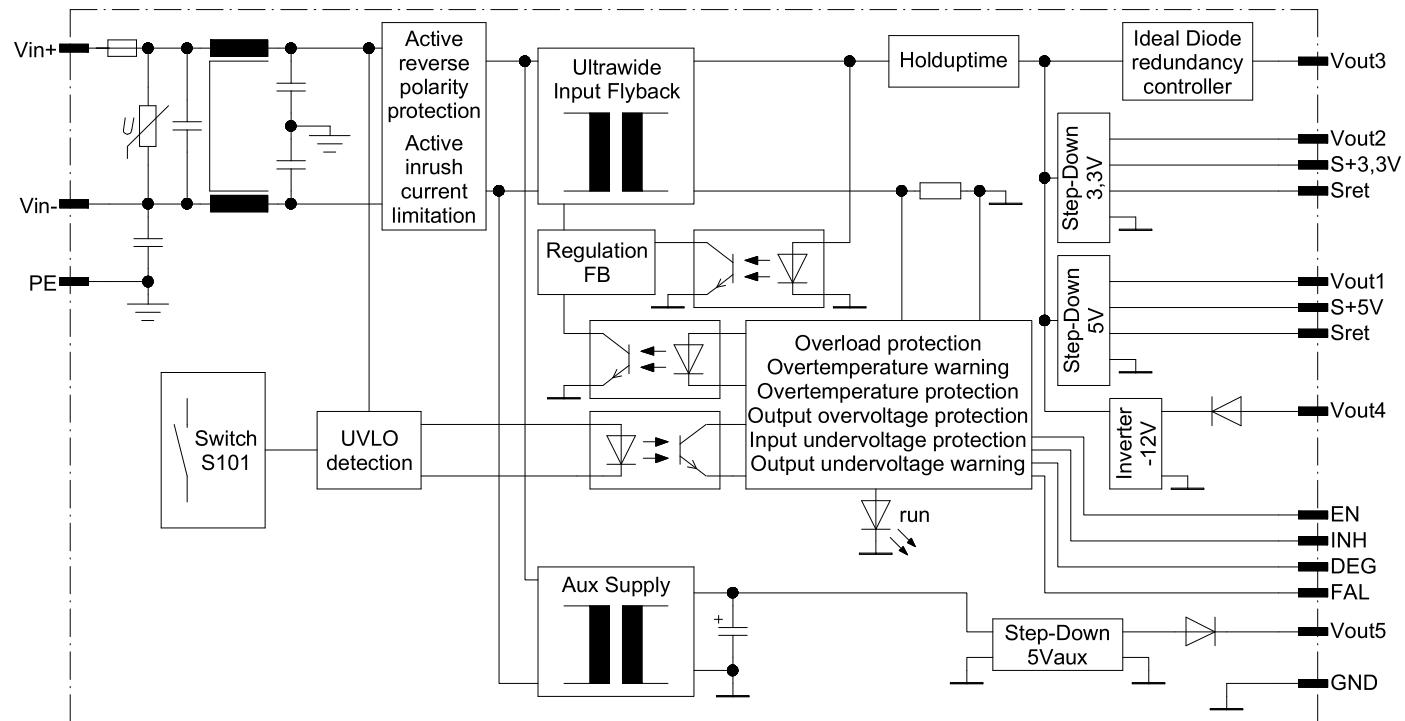

Attention! At Pout max (for time > 1min) a warming up of the front plate up to 15°C over the ambient temperature is possible.

Fault protection:

The converters are equipped with a soldered-in time-lag fuse corresponding to IEC 60127-2 for input protection.

In case of fault the supplying current source must be capable to blow the fuse. In some applications 2 fuses would be necessary, one in each input line.

### BLOCK DIAGRAM

## DESCRIPTION OF FEATURES

For  $T_{amb}=25^{\circ}\text{C}$ ,  $V_{in\ nom}/I_{out\ nom}$  unless otherwise specified

### INPUT VOLTAGE DETECTION

With this rotating switch S101 the undervoltage levels can be set.

Switch position	0	1	2	3	4	5
Vin nominal (V)	24	36	48	72	96	110
Under voltage turn-off (V)	12...14	20...21	25...28	40...42	52...56	60...64

At all other positions, the UVLO level is 12V...14V

### ENABLE SIGNAL / INHIBIT SIGNAL

Inputs	Reference to GND	Low-Level: 0V...0,8V	High-Level 8V...9V or open (Logic see table)
INH	Low	Low	High
EN	Low	High	Low
Power Status	"Off"	"Off"	"On"

The pin sources about 170  $\mu\text{A}$  at low level.

### SUPPLY FAIL SIGNAL

The Supply Fail Signal is an open-collector output, emitter grounded (npn-Transistor). Active level: low.

Maximum current = 20 mA, maximum voltage = 9 V, saturation voltage < 0,5 V.

FAL switches Low, if one of the outputs 1-4 is out of tolerance of  $\pm 10\%$  or if Vin breaks down. If Vin breaks down, it remains 5 ms between the edge of the FAL-Signal and the break down of Vout.

### DERATE SIGNAL

The Derate Signal is an open-collector output, emitter grounded (npn-Transistor). Active level: low.

Maximum current = 20 mA, maximum voltage = 9 V, saturation voltage < 0,5 V.

### SENSE

Sense connection is not required. If it is accomplished, the voltage at the load is reduced by ca. 100 mV. This feature provides compensation of voltage drops (max. 0,2 V each line) at Vout1 and Vout2 between power supply and load. The pins Sense return, Sense +5 V and Sense +3,3 V must be connected with the load. The sense signal should not be longer than 0,4m.

### OVER CURRENT PROTECTION

If Vout1 is shut down due to overload, Vout2 will also be switched-off too.

### LED

Blinking LED indicates:

- Vin is lower than adjusted under voltage turn-off value
- One of the output voltages 1-4 is not in specified range
- Converter is in standby mode

Lightning LED indicates:

- Converter is in normal operating mode

### REDUNDANT OPERATION

The outputs 3-5 are build for redundant operation with one other converter in parallel. The connected wires between the converters should be as short as possible. Output voltages 1 and 2 are not prepared for redundant operation.
